What the data told us

Demo on your dataset farm in Milano. Our story is the Cretan olive market we are building for.

WHAT WE USED

DG AGRI synthetic dataset

Farm FARM-13079 · Milano, NUTS3 ITC4C
371 ha · 62 parcels · organic · Natura 2000
Common wheat 137 ha · barley 83 · maize 62
sunflower 61 · rapeseed 28
10 years of harvest, inputs, irrigation, labour, sales and certificates

Eurostat GISCO

NUTS 2024 outlines — the 60 km season-planner map

Simulated for the demo

Job posts, worker pool, chats, agreements

The dataset itself is not in our repository (about 12 GB, git-ignored). The extracted farm files are, so the app runs without it.

1 · 9,517 hours. Not one seasonal worker.

All recorded labour is holder, family or paid-regular — on a 371 ha farm that harvests 2,600 t a year.

→ **So Kuluri records the work nobody logs: the worker confirms their own week.**

2 · 20 of 30 sales cannot prove the claim.

The organic certificate is valid 2024-2026 only. Two thirds of sales carry no date-valid holding certificate.

→ **So Buyer requests answers from confirmed records — totals only.**

3 · Proof has to travel to 22 buyers.

22 distinct buyers over ten years, on forward, cooperative and spot contracts. 15 of 30 sales below reference price.

→ **So one record is re-used for every buyer and every CAP social-conditionality check.**

Synthetic dataset only · no real personal data · every figure reproducible with app/scripts/extract_farm.py · simulated demo content is labelled in the app

How we used AI

Declared, as the Hack Guide asks. Allowed, optional, transparent.

TO BUILD IT

Scoping Idea and dataset exploration, feasibility, market model

App Supervised code generation (Vue 3 / Quasar / Capacitor)

Docs & diagrams README, terms, citation metadata, architecture diagrams

This deck Structure, wording and slide generation

Every output was reviewed before it was merged and is owned by a named team member. The git history shows which commits, line by line.

INSIDE THE PRODUCT: NONE

No AI model is queried anywhere in the prototype. The chat analysis that drafts agreement terms is transparent rule-based extraction — auditable line by line, in app/src/data/agreements.js.

Deliberate: a product whose job is to make labour records trustworthy should not start with a non-deterministic core.

GENERATED DEMO CONTENT, AND WHAT COMES NEXT

AI-generated, illustrative, not verified data: the seeded chats, the worker pool, the job posts and the Romanian interface strings (machine-translated, not professionally reviewed).

Planned, with safeguards: voice transcription and translation, original always shown beside it. Any future LLM agreement drafting only with both parties' consent, always citing the messages it used.
